I. Purpose
The purpose of this document is to provide standard operating procedures for the use of autoclaves. Autoclaving is a process used to destroy microorganisms and decontaminate biohazard waste and microbiological equipment used at Biosafety Level 1 and 2.

II. Risk Management

A. Health and Safety
The health and safety of the personnel using the autoclave is essential, therefore it is important for each department to maintain autoclaves and provide training for personnel using the autoclave.

- the name of the person responsible for the autoclave shall be posted near the autoclave
- this SOP should be posted in an area closer to the autoclave
- it is the responsibility of the PI or supervisor to ensure students and employees are trained before operating any autoclave unit
- procedural and instructional documents provided by the manufacturer must be available
- PPE must be worn when loading and unloading the autoclave
- a basic visual inspection should be performed monthly by the person responsible for the autoclaves
- autoclaves must be inspected at least annually. The preventive maintenance performed by the manufacturer is adequate

B. Potential Risks
Autoclaves use high pressure and high temperature steam for sterilization. The possible safety risks for the operators include:

- body injury if there is an explosion
- hand and arm injuries when closing the door
- heat burn from hot materials and autoclave chambers wall and door
- hot fluid scalds from boiling liquids and spillage in autoclave
- steam burns from residual stream from the autoclave and materials on completion

C. Personal Protective Equipment
The listed equipment can be used to protect against scalds and burns

- heat-insulating gloves
- lab coats
III. Operator Instructions

A. Training

All personnel who use or may use autoclaves must be successfully trained on the safe operating procedure. The training can be administered by either the PI, the lab supervisor or an experienced operator. This training applies to new and existing personnel.

B. Material Preparation

- Ensure that the material is safe for autoclaving:
  - samples containing solvents or substances that may emit toxic fumes should not be autoclaved
  - do not autoclave bleach

- Glassware must be inspected for cracks prior to autoclaving.

- Prepare and package material suitably:
  - loose dry materials must be wrapped or bagged in steam-penetrating paper or loosely covered with aluminum foil. Wrapping too tightly will impede steam penetration, decreasing effectiveness of the process
  - loosen all lids to prevent pressure buildup. All containers must be covered by a loosened lid or steam-penetrating bung
  - containers of liquid must not exceed two-thirds (2/3) full, with lids loosened. Glassware must be heat-resistant borosilicate
  - plastics must be heat-resistant, i.e., polycarbonate (PC), PTFE (“Teflon”) and most polypropylene (PP) items
  - discarded sharps must be in a designated ‘Sharps’ container
  - all items must be tagged with autoclave tape

- Place items in secondary containers to secure and contain spills:
  - items should be placed in a stainless steel pan or other autoclavable container for their stability and ease of handling
  - place containers of liquid, bags of agar plates, or other materials that may boil over or leak, into a secondary pan in the autoclave
  - the pan must be large enough to contain a total spill of the contents
  - bags must not be tightly sealed as steam cannot penetrate

C. Loading Autoclave

- wear lab coat, eye protection, heat-insulating gloves, and closed-toe shoes
- place material in autoclave, Do not mix incompatible materials
- do not overload; leave sufficient room for steam circulation, If necessary, place the container on
its side to maximize steam penetration and avoid entrapment of air
• close and latch door firmly

D. Operating Autoclave
• close and lock door
• choose appropriate cycle (i.e., gravity, liquid, or dry cycle) for the material Consult the autoclave manual for assistance in choosing a cycle, The manuals for operation of the autoclave should be located near the autoclave
• set appropriate time and temperature if you are using a customized cycle
• start your cycle and fill out the autoclave user log with your contact information, A completed cycle usually takes between 1-1.5 hours, depending on type of cycle
• do not attempt to open the door while autoclave is operating
• if problems with your autoclave are perceived, abort cycle and report it to your PI immediately

E. Unloading Autoclave
• wear heat-insulating gloves, eye protection, lab coat, and closed-toe shoes
• ensure that the cycle has completed and both temperature and pressure have returned to a safe range
• wearing PPE, stand back from the door as a precaution and carefully open door no more than 1 inch.
• This will release residual steam and allow pressure within liquids and containers to normalize
  o allow the autoclaved load to stand for 10 minutes in the chamber, This will allow steam to clear and trapped air to escape from hot liquids, reducing risk to operator
  o do not agitate containers of super-heated liquids or remove caps before unloading
  o wearing heat-insulated gloves remove items from the autoclave and place them in an area which clearly indicates the items are 'hot' until the items cool to room temperature
  o shut autoclave door

F. Autoclave Use Log
• entries must be placed in the log book each time the autoclave is used, These records are used for maintenance/service schedules and reporting of incidents, accidents and/or faults
• entries should include: operator's name, date, time and duration
• the log book must be kept adjacent to the autoclave
• an autoclave Use Log example is provided in this document
G. Maintenance and Repair

- no person shall operate the autoclave unless the autoclave is in good repair
- only qualified professionals are permitted to make repairs
- repairs are performed by your service contract or any other contractor you choose to hire

IV. Emergency Plans

A. Equipment Malfunction

- if the autoclave does not operate exactly as expected, do not attempt to fix the problem
  A notice shall be placed on the autoclave indicating that it is not to be used until the
  problem is diagnosed and corrected
- record the problem in the autoclave log book
- contact the manufacturer, PI or your supervisor to report the problem
- only qualified professionals are permitted to make repairs

B. Incident Response

- all incidents, including a spill or release of biohazardous materials or recombinant DNA, must be
  reported to your supervisor or the PI
- if any injury occurs seek first aid or, if necessary, seek medical assistance by dialing MTSU
  Campus Police at 615-898-2424 or 911
- if clothing is soaked in hot water or steam, remove clothing and place the injury in cool water
- place a notice on the autoclave indicating that it is not to be used until the cause of the incident
  is determined, procedures enacted to prevent future incidents, and the autoclave is deemed
  safe for operation

C. Spill Clean-up

- spills may occur from a boil-over or breakage of containers
- no operation of the autoclave is allowed until the spill is cleaned up
- the operator is responsible for clean-up of spills, Contain the spilled material using paper
  towels. Use your laboratory's spill kit if necessary. Wait until the autoclave and materials
  have cooled to room temperature before attempting clean-up
- review the SDS, if appropriate, to determine appropriate PPE, spill cleanup and disposal
  protocols that are necessary
- dispose of the waste following the protocol appropriate for the material (i.e., red
  biohazard bag), If materials have been intermingled, follow the clean-up and disposal
  protocol for the most hazardous component of the mixture
- cracked glassware must be disposed of properly
- record the spill and clean-up procedure in the autoclave log book
